Viezbicke 1977 Array Pattern Optimization Jafar Ramadhan Mohammed 2019-03-27 Array pattern optimization is a very important and necessary issue in the majority of modern communication systems in a variety of applications such as sonar, radar, navigation, wireless communications, and many other engineering fields. Classical methods for array pattern synthesis have worked mainly with analytical models that are linear, local and, thus, their

performances were not optimum. They have always been designed with closed-form mathematical models. Unlike these analytical methods, the global optimization methods with powerful computing tools offer optimum solutions. During the last few years, the design of the antenna arrays has been a topic of significant research activity. This book presents recent advances in the field of array pattern optimization. It is targeted primarily toward students and researchers who want to be exposed to a wide variety of antenna array design and optimization. It includes five chapters as well as the introductory chapter. These five chapters are categorized into five different areas depending on the application. These applications are ordered to address interference suppression, electronic toll collection, mmWave and ultra-wideband, integrated antennas, and educational packages for modeling smart antenna for

5G wireless communications. The book has the advantage of providing a collection of applications that are entirely independent and self-contained; thus, the interested reader can choose any chapter and skip to another without losing continuity.

High Efficiency Planar and RFIC-based Antennas for Millimeter-wave Communication Systems Ramadan A. Alhalabi 2010

The dissertation presents the design and measurements of several planar and RFIC-based high efficiency antennas for mm-wave applications. The high-efficiency microstrip-fed endfire angled-dipole antenna is designed mainly for

phased-array applications. It is built on both sides of a Teflon substrate ($\epsilon_r = 2.2$) and allows a wideband feed from the single-ended microstrip line to the differential dipole. The design results in wide radiation patterns for scanning purposes with a gain of around 2.5 dB at 20 - 26 GHz and a cross-polarization level of -15 dB at 24 GHz. A mutual coupling of -23 dB is measured between adjacent elements with 6.8 mm center-to center spacing ($0.50 - 0.54\lambda_0$ at 22 - 24 GHz). A variant of the angled-dipole antenna with a magnetic ground plane edge was also developed, and shows a measured gain of 6 dB at 23.2 - 24.6 GHz and very low mutual coupling between elements (-23 dB for a 6.8 mm spacing). Both antennas result in a radiation efficiency of 93% when referenced to the microstrip line feed. The usefulness of these antennas as phased-array radiators is demonstrated by several

eight-element linear arrays at 22 - 24 GHz with scan angle up to 50 & deg. High-efficiency microstrip-fed and CPS-fed Yagi-Uda antennas have also been developed for point-to-point millimeter-wave communication systems. The antennas are built on Teflon substrates ($\epsilon_r = 2.2$); and utilize 5 directors to result in a gain of 8 - 12 dB at 24 GHz and 60 GHz. A mutual coupling of -20 dB is measured between two microstrip-fed Yagi-Uda antennas with a center-to center spacing of 8.75 mm ($0.7\lambda_0$ at 24 GHz), and a two-element array results in a measured gain of 11.5-13.0 dB at 22-25 GHz. The planar Yagi-Uda antennas result in high radiation efficiency (90%) and is suitable for short-range mm-wave radars and high data-rate communication systems. A differential version was also developed using a folded dipole feed and is compatible with fully-differential RFICs. Self-shielded microstrip-

fed Yagi-Uda antenna has also been developed for 60 GHz communications. The antennas are built on a Teflon substrates ($\epsilon_r = 2.2$) with a thickness of 10 mils (0.254 mm). A 7-element design results in a gain 9.5 dB at 58 - 63 GHz. The antenna shows excellent performance in free space and in the presence of metal-planes used for shielding purposes. A parametric study is done with metal plane heights (h) from 2 mm to 11 mm, and the Yagi-Uda antenna results in a gain 12 dB at 58 - 63 GHz for $h = 5 - 8$ mm. A 60 GHz four-element switched-beam Yagi-Uda array is also presented with top and bottom shielding planes, and allows for 180 & deg angular coverage with 3 dB amplitude variations. This antenna is ideal for inclusion in complex platforms, such as laptops, for point-to-point communication systems, either as a single element or a switched-beam system. MM-wave planar

monopole antennas have been also demonstrated. A triangular and a straight monopole antennas result in a measured S_{11}

This book is ideal for both industrial and academic researchers, scientists, engineers, educators, practitioners, developers, policymakers, scholars, and students interested in 5G technology and the future of engineering, computing, and technology in human society.

Real-world Multi-objective System Engineering Nadia Nedjah 2005 Real-world engineering problems often require concurrent optimisation of several design objectives, which are conflicting in most of the cases. Such an optimisation is generally called multi-objective or multi-criterion optimisation. The area of research that applies evolutionary methodologies to multi-objective optimisation is of special and growing interest. It brings a solution to many yet-opened real-world problems and questions. Generally, multi-objective engineering problems have no single optimal design, but several solutions of equal efficiency allowing different trade-offs. The decision maker's preferences are normally used to select the most adequate

design. Such preferences may be dictated before or after the optimisation takes place. They may also be introduced interactively at different levels of the optimisation process. Multi-objective optimisation methods can be subdivided into classical and evolutionary. The classical methods usually aim at a single solution while the evolutionary methods target a whole set of so-called Pareto-optimal solutions. of the evolutionary multi-objective optimisation research area and related new trends. Furthermore, it reports many innovative designs yielded by the application of such optimisation methods. The contents of the book are divided into two main parts: evolutionary multi-objective optimisation and evolutionary multi-objective designs.
